PHYSICS: Package I

SENIOR DIVISION

THE ONTARIO ASSESSMENT INSTRUMENT POOL

© The Minister of Education, Ontario 1983
Queen's Park
Toronto, Ontario

reprinted 1986

ISBN 0-7743-6698-2
ISSN 0228-0957
CD 01650

This package contains selected response instruments: multiple choice and alternate response instruments. Most of the instruments are suitable for use in evaluating the aims, goals, and objectives of Senior Division Physics. However, some instruments can be used for diagnostic purposes at the Ontario Academic Course Level. Additional materials will be distributed as they become available.

Cost: $15.00

Copies of this package may be obtained from:

Ontario Government Bookstore
880 Bay Street
Toronto, Ontario

ONTARIO ASSESSMENT INSTRUMENT POOL
BANQUE D'INSTRUMENTS DE MESURE DE L'ONTARIO

The Ontario Assessment Instrument Pool/Banque d'instruments de mesure de l'Ontario (OAIP/BIMO) is a resource designed to assist those in education in fulfilling their responsibilities for evaluating student achievement and the effectiveness of programs in elementary and secondary schools. OAIP/BIMO consists of a large collection of questions in a variety of formats for several subject areas and grade levels. These questions are based on Ontario curriculum guidelines.

OAIP/BIMO materials are intended for use at the classroom, school, system, and provincial levels. At the classroom level, they can be used for instructional as well as assessment purposes. At all levels, their use can provide information related to student achievement for the purposes of (i) evaluating and planning improvements in educational policies and instructional programs, (ii) reporting on the effectiveness and appropriateness of existing policies and programs, and (iii) reporting on the overall progress of groups of students. OAIP/BIMO materials are designed to augment currently used evaluation strategies and tools. It is inappropriate to use them for the purpose of teacher evaluation. Public reporting of comparisons between classes or schools or school boards would also be inappropriate.

POOLS CURRENTLY AVAILABLE

OAIP	English	Intermediate Division
	Geography	Intermediate Division
	History	Intermediate Division
	Mathematics	Junior Division
	French as a Second Language	Grades 6 and 10
	Chemistry	Senior Division
	Physics	Senior Division
BIMO	Anglais	Cycle moyen
	Anglais	Cycle intermédiare
	Français	Cycle moyen
	Français	Cycle intermédiare
	Géographie	Cycle intermédiare
	Chimie	Cycle supérieur
	Physique	Cycle supérieur
	Histoire	Cycle intermédiare (available in Fall 1986)

POOLS BEING DEVELOPED

Pool	Tentative Release Date
OAC Biology	June 1988
Language Arts, Junior Division	January 1989
Mathematics, Intermediate Division (New Pool)	June 1989
Science, Intermediate Division	June 1989
English, Senior Division	June 1989
Science, Junior Division	June 1989
Mathematics, Senior Division	December 1989
Français, cycle supérieur	September 1990
Mathématique, cycle moyen	February 1987

Arrangements are being made for the development of BIMO pools for Intermediate and Senior Divisions in Mathematics and Science.

Basic level pools will also be developed for English, Mathematics, and Science and equivalent pools will be developed for BIMO.

CONSTRUCTING A TEST

The following hints may be of assistance:

1. If more than one type of instrument is used in a test, group instruments of like format together, e.g., multiple choice instruments first, true-false instruments next, etc.

2. The size of the published instruments is ideal for making review transparencies. To save paper when making tests the instruments can be photoreduced by a factor of 64% and assembled as shown on the following page. However, photoreduction of selected response instruments involving measured quantities may result in the key not being among the choices or the key being a different choice than intended. An example illustrating this problem is included on the following page. Photoreduce instruments for tests, but be on the lookout for this fault.

1 How many significant digits are there in the number 0.340 050?

(A) 3

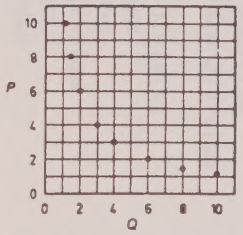
(B) 4

(C) 5

(D) 6

(E) 7

2 The measured values of P and Q as obtained in an experiment were plotted as shown in the figure.



Which one of the following relationships best fits the experimental results?

(A) $P \propto Q$

(B) $P \propto Q^2$

(C) $P \propto \frac{1}{Q}$

(D) $P \propto \frac{1}{Q^2}$

(E) $Q \propto \frac{1}{P^2}$

3 An object is thrown straight up from ground level with a speed of 50 m/s. Its distance above ground 1.0 s after being thrown is

(A) 25 m

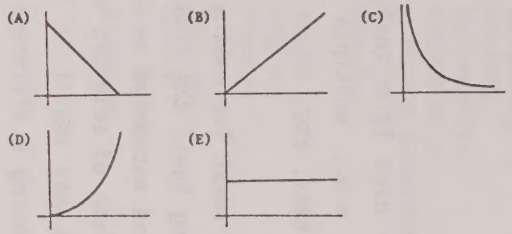
(B) 30 m

(C) 40 m

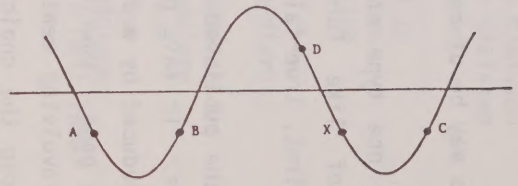
(D) 45 m

(E) 50 m

4 A cart is placed on a frictionless, horizontal surface and is moved by means of elastic bands of identical structure. The mass of the cart may be changed by placing masses on it. From the graphs below, select the one which best describes speed versus time when the cart is pulled by a force which is increasing uniformly with time.



5 The following diagram shows a transverse wave. Use a ruler to take any necessary measurements.



The wavelength of this wave is approximately

(A) 12 cm

(B) 6 cm

(C) 4 cm

(D) 3 cm

(E) 2 cm

The key for the full sized instrument was B. The key for the photoreduction is C.

3.6 cm — 8.5 cm — 3.6 cm — 8.5 cm — 3.6 cm

The geological past is often divided into eras and periods according to the chart below.

Era	Period	Years elapsed to present
		present
Cenozoic	Quaternary	1.7×10^6
	Tertiary	5.5×10^7
Mesozoic	Cretaceous	1.2×10^8
	Jurassic	1.3×10^8
	Triassic	1.5×10^8
Paleozoic	Carboniferous	2.7×10^8
	Devonian	3.0×10^8
	Silurian	3.5×10^8
	Ordovician	3.8×10^8
	Cambrian	4.7×10^8
Proterozoic	Pre-Cambrian	1.0×10^9

Certain deposits at sea level at the end of the Triassic period were subsequently lifted to their present elevation of approximately 2000 m above sea level. If the time rate of elevation has been constant, the average rate of uplifting must have been about

(A) 1.5×10^{-11} m/a

(B) 6.5×10^{-7} m/a

(C) 1.5×10^{-5} m/a

(D) 6.5×10^{-4} m/a

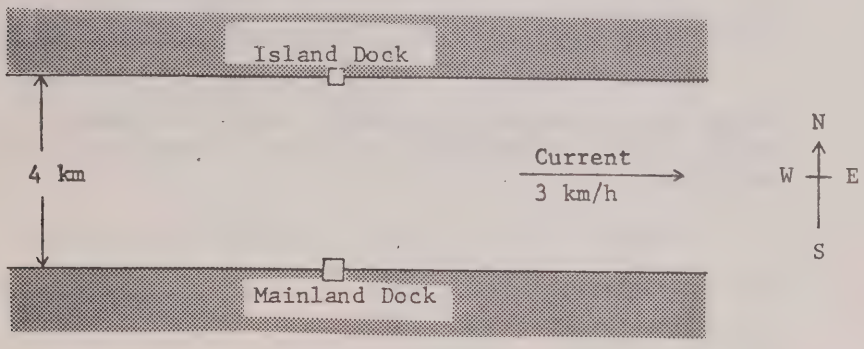
A man lives on an island 4 km offshore, across a channel which has a 3 km/h current when the tide is running. On a dark night, with the tide running, he rows from the mainland dock towards the island, keeping his boat aimed directly north. He rows his boat at a speed of 4 km/h relative to the water.



In order to row directly across to the island dock, he should have set his course upcurrent at an angle west of north. The sine of that angle is

(A) $\frac{5}{3}$

(B) $\frac{5}{4}$

(C) $\frac{4}{5}$

(D) $\frac{3}{4}$

(E) $\frac{3}{5}$

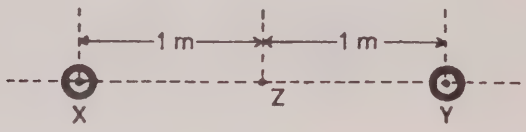
Two metal spheres, each of mass 5 kg, are fixed in position at points X and Y as shown in the diagram below. A third sphere of mass 1/100 kg is released from rest at point Z and is affected only by the forces of gravitational attraction exerted on it by the masses at points X and Y. Point Z is located exactly midway between points X and Y. The gravitational constant is represented by the symbol "G".



The net force, in newtons, acting on the smaller mass at the instant of release would be

(A) 25 x G

(B) 10 x G

(C) $\frac{G}{10}$

(D) $\frac{G}{20}$

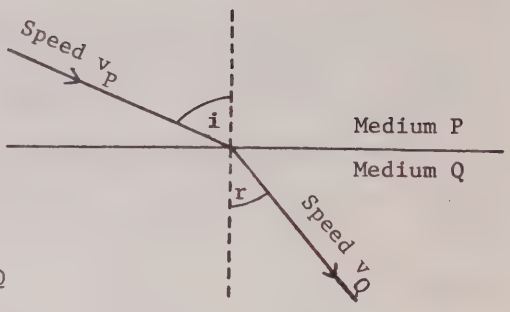
A ray of light travels from medium P into medium Q, and is refracted toward the normal.



Consider the following statements:

I. $\sin i/\sin r = v_P/v_Q$

II. $\sin i/\sin r = v_Q/v_P$

III. $v_P > v_Q$

IV. $v_Q > v_P$

Which combination of the above statements is true according to the particle model?

(A) I and III only

(B) II and IV only

(C) I and IV only

(D) II and III only
